

GESTAMP AUTOMOCIÓN S.A.

COMPREHENSIVE DIGITAL AND AI CAPABILITIES REPORT

SECTION 1 — Quantitative investment baseline

1.1 Capital Allocation, R&D Expenses, and Financial Realities

Uploaded-document evidence:

Gestamp's financial disclosures for the 2025 fiscal year demonstrate a highly complex and capital-disciplined operating environment. The company reported a net revenue of eleven thousand three hundred and forty-eight point six million euros for the 2025 financial period, representing a year-over-year contraction of five point four percent compared to the twelve thousand point zero million euros reported in the 2024 financial period.¹ Despite this decline in top-line revenue, Gestamp's earnings before interest, taxes, depreciation, and amortization (EBITDA) stood at one thousand three hundred and seven point three million euros, representing a stable performance with a positive variation of one percent.¹ Under Gestamp's accounting disclosures, research and development costs are expensed as incurred.² While Gestamp does not isolate a distinct, single research and development expense figure in its public 2025 management report¹, the company highlights that the broader pool of direct operating costs—which includes research and development, building renovations, short-term leasing, and maintenance and repairs—totaled four hundred and fifteen point one million euros, representing four point zero three percent of the group's total annual operating costs of ten thousand three hundred point nine million euros.¹ Gestamp's capital expenditure (CapEx) reached nine hundred point three million euros in 2025, which funds both active capacity maintenance and strategic modernization projects.¹

Public-source evidence:

Public financial statements confirm that Gestamp's consolidated net income for 2025 declined by nineteen percent year-on-year to one hundred and fifty-two million euros.³ This drop was driven by the realignment of vehicle electrification targets by key original equipment manufacturers (OEMs), which forced Gestamp to enter into customer compensation agreements that negatively impacted earnings before interest and taxes (EBIT) by fifty-two million euros.⁴ However, the company successfully reduced its net debt by thirteen percent (or two hundred and seventy-six million euros) over the year, bringing total net debt to one point eight billion euros at year-end 2025.³ This debt reduction lowered Gestamp's leverage to a net debt-to-EBITDA ratio of one point four times, the lowest level achieved since the company's initial public offering in 2017.³ The Phoenix Plan's restructuring of the NAFTA business

accounted for a profit and loss impact of fifteen point nine million euros and an associated CapEx of twelve point eight million euros in 2025, compared to a profit and loss impact of twenty-four point nine million euros and a CapEx of six point two million euros in 2024.³ Gestamp's free cash flow, excluding the impact of the Phoenix Plan, reached two hundred and seventy-eight million euros in 2025, showing significant improvement from the one hundred and seventy-eight million euros generated in 2024.³

Assessment:

The quantitative financial baseline indicates that Gestamp is operating under strict capital discipline, actively reducing its overall leverage while defending its operating margins.³ The reduction of net debt to one point eight billion euros, coupled with an increased return on capital employed (ROCE) of fifteen point eight percent in 2025 compared to fifteen point zero percent in 2024, reveals that Gestamp is prioritizing capital efficiency over aggressive, unhedged capacity expansion.³ Technology investments are no longer funded through unrestricted corporate debt; instead, they are financed through optimized free cash flow and strategic capital partnerships.³ This operational posture forces Gestamp to tie its digital transformation directly to tangible plant-level profitability and efficiency metrics rather than speculative technical pilots.¹

1.2 Digital Operations and Environmental Taxonomy Capitalization

Uploaded-document evidence:

Gestamp's reporting under the European Union Green Taxonomy outlines the precise financial contribution of its sustainable and low-carbon technologies.¹ During 2025, Gestamp's taxonomically eligible revenues reached thirteen point four percent of the group total, with taxonomically aligned revenues reaching twelve point four percent, which equates to one thousand four hundred and eight point twenty-two million euros.¹ In terms of investment, Gestamp's taxonomically eligible CapEx reached twenty-four point three percent of the group total, with taxonomically aligned CapEx standing at twenty-four point zero percent, representing two hundred and sixteen point zero million euros.¹ These aligned activities correspond primarily to climate change mitigation and are concentrated in three key industrial operations: the manufacture of battery, cell, and accumulator casings (specifically, structural battery boxes under taxonomy activity three point four), the manufacture of lightweight hot-stamped automotive body components (such as Door Rings under taxonomy activity three point eighteen), and the collection and source-segregated transport of non-hazardous metal waste by its Gescrap subsidiary (taxonomy activity five point five).¹ In terms of direct decarbonization and energy investments, Gestamp spent seven hundred and twenty-six point two thousand euros on plant electrification in 2025, with an expanded investment of two point sixty-eight million euros planned for 2026.¹ Additionally, the corporate Energy Efficiency department executed one point nineteen million euros in CapEx during 2025, driving plant-level optimization projects that helped reduce Gestamp's carbon dioxide equivalent emissions index by three percent.¹

Public-source evidence:

While Gestamp's public investor materials do not separate a general corporate IT or digital transformation budget as a standalone financial line item, they highlight that the company's Gescrap business, specializing in industrial metal recycling, represents four point seven percent of Gestamp's consolidated turnover.¹ This business acts as a vital circular loop, supplying high-quality steel scrap back to steel manufacturers like SSAB and Hyndnum Steel to produce low-emission steel, which Gestamp subsequently purchases to manufacture lightweight parts for OEMs.¹ Gescrap's operations contributed five hundred and thirty-four point forty-seven million euros in taxonomically aligned turnover and eleven point sixty-three million euros in taxonomically aligned CapEx during 2025.¹

Assessment:

The alignment of Gestamp's CapEx with the EU Green Taxonomy at twenty-four point zero percent demonstrates that nearly a quarter of Gestamp's capital deployment is explicitly tied to the transition toward electric vehicles and low-carbon manufacturing processes.¹ The concentration of two hundred and sixteen point zero million euros of CapEx into battery boxes and lightweight components reveals that Gestamp's product portfolio is undergoing a deep structural shift.¹ Rather than treating digital systems and environmental sustainability as separate operational paths, Gestamp is integrating them.¹ The deployment of specialized IoT systems, such as the proprietary CO2Tem platform, allows Gestamp to continuously collect and analyze energy consumption data.¹ This links digital software capability directly to carbon reduction, ensuring that energy efficiency CapEx is backed by auditable data.¹

1.3 Real Estate Portfolio Optimization and Syndicated Debt Restructuring

Uploaded-document evidence:

Gestamp's corporate risk management and economic strategy for 2025 focused heavily on balance sheet optimization.¹ The company continued to monitor financial market fluctuations and implemented strict controls to mitigate interest rate and foreign exchange exposure.¹ To manage liquidity and capital commitments, Gestamp continued to work on the design and rollout of its Sustainability Information Internal Control System (ISICS/SCIIS), whose governance model was approved by the Board of Directors on July twenty-eight, 2025.¹ This system ensures that sustainability and non-financial data are subject to the same internal controls and auditing procedures as traditional financial information.¹

Public-source evidence:

During the third quarter of 2025, Gestamp completed a major strategic real estate transaction.⁷ In July 2025, Gestamp finalized an agreement with Banco Santander under which the financial institution's investment entity, Andromeda Principal Investments S.L.U., acquired a

minority stake in the share capital of four Gestamp subsidiaries that own Gestamp's real estate assets in Spain for two hundred and forty-six million euros.³ This transaction was designed to crystallize the value of Gestamp's physical real estate assets and strengthen the corporate balance sheet.⁷ In parallel, Gestamp restructured its corporate debt by pricing an offering of five hundred million euros in senior secured notes due in 2030 at an issue price of one hundred percent with a coupon rate of four point three hundred and seventy-five percent.⁴ To further extend its liability maturity profile, Gestamp formalized a key amendment to its Senior Facilities Agreement (SFA) in January 2026, improving the terms of one thousand seven hundred million euros of corporate debt with the support of eighteen banking institutions.⁴

Assessment:

The monetization of Spanish real estate assets for two hundred and forty-six million euros and the refinancing of corporate debt through the five hundred million euro bond issuance indicate a clear strategy to maximize liquidity and reduce financial pressure.³ By partnering with Banco Santander, Gestamp has unlocked significant cash reserves without giving up operational control of its manufacturing facilities.⁷ This optimized balance sheet provides Gestamp with the financial flexibility needed to support high-efficiency Industry four point zero investments, such as the global deployment of connected assembly lines, while navigating a highly volatile automotive market marked by slow electric vehicle adoption.³

SECTION 2 — Capability-by-capability analysis, including GenAI and agentic systems

2.1 Machine Learning for Image-Based Weld Defect Detection

Uploaded-document evidence:

Gestamp's Process Quality department is responsible for enforcing organization-wide standards and quality methods across critical manufacturing technologies.¹ Special attention is given to processes like arc welding, spot welding, and laser welding, where components must often be destructively tested to verify their structural integrity.¹ To shift from destructive and reactive quality controls toward a preventive model, Gestamp's quality teams worked throughout 2025 on extracting value from Industry four point zero tools.¹ This work involved executing trials with various control equipment that utilize deep learning and artificial intelligence, aiming to maximize the analytical value of existing quality inspection systems.¹

Public-source evidence:

To build this capability, Gestamp partnered with the Basque Artificial Intelligence Center (BAIC) to develop a specialized computer vision and machine learning algorithm.⁸ This project was designed to create an algorithm that processes weld bead images collected from existing industrial weld bead scanning systems, such as Mapvision and SmartRay.⁸ The deep learning model is trained to automatically classify the specific type of weld defect, identify anomalous

welding cycles, and establish automatic signal validation rules.⁸ This model correlates real-time weld bead images with physical welding process parameters.⁸ The initial deployment and verification of this computer vision capability were scheduled for a Spanish Gestamp plant, targeting an assembly line equipped with image acquisition systems and integrating at least two core manufacturing processes, such as press hardening (PHD), cold stamping, or electrocoating (ecoat).⁸ The organizational resources allocated to this project include Gestamp's corporate AI team, the plant-level Gestamp adoption area, and senior welding experts.⁸

Assessment:

This capability is classified as a pilot and development activity.⁸ By using advanced deep learning to analyze weld bead scans, Gestamp is addressing a key engineering challenge in automotive manufacturing: the real-time, non-destructive verification of structural welds.¹ Historically, verifying weld quality required manual inspections or destructive testing of sample parts, which slowed down production and increased scrap waste.¹ Shifting this process to an automated, image-based machine learning model allows Gestamp to establish a digital birth certificate for each manufactured assembly.¹⁰ This significantly reduces the risk of delivering defective structural components to OEMs, minimizing the potential for expensive product recalls and protecting the company's brand reputation.¹ The successful validation of this pilot on a high-speed assembly line in Spain provides Gestamp with a scalable quality template that can be rolled out across its global network of one hundred and fifteen factories.⁸

2.2 Industrial IoT, Edge Computing, and Digital Twin Simulation

Uploaded-document evidence:

Gestamp has built a robust Industry four point zero model aimed at creating highly efficient and flexible production plants.¹ To date, the company has deployed over two hundred seventy-five industrial Internet of Things (IoT) projects and executed more than two hundred simulation and virtualization projects for manufacturing processes and logistical flows.¹ These digital tools are connected to physical manufacturing machinery across hot stamping, cold stamping, chassis manufacturing, and spot-welding processes.¹ In 2025, Gestamp transitioned its digital strategy from basic connectivity toward a profit-oriented model.¹ This model uses real-time data ingestion, early anomaly detection, and digital assistance to stabilize unstable processes and protect plant profitability.¹

Public-source evidence:

Gestamp partnered with Telefónica Tech to implement a corporate digital twin architecture.¹² This architecture uses private five-G networks and Multi-Access Edge Computing (MEC) to connect physical industrial equipment with virtualized factory models residing on the edge network.¹² This edge-computing setup captures and processes data produced by industrial machines in near real-time, enabling rapid scenario validation and decision-making.¹²

Additionally, partner case studies from DXC Technology indicate that Gestamp has connected over seventy production plants globally and applied more than ten thousand artificial intelligence rules to shop-floor machinery.¹³ This cloud and edge architecture allows Gestamp to transition its manufacturing operations from simple robotization toward a data-driven model.¹¹

Assessment:

The evidence supports a status of production and operational deployment for Gestamp's IoT and digital twin capabilities, with clear signs of scaled internal deployment across seventy plants.¹³ By combining Telefónica Tech's five-G edge processing with DXC's cloud-native systems, Gestamp has built a highly responsive digital twin infrastructure.¹¹ This infrastructure solves a major manufacturing challenge: the lag between shop-floor events and management visibility.¹⁵ The deployment of ten thousand active AI rules allows Gestamp to monitor machine health, run predictive maintenance, and reduce unscheduled downtime.¹³ This shift to digital twin simulation has a direct impact on plant profitability by optimizing raw material usage and maximizing overall equipment effectiveness (OEE).¹

2.3 Generative AI Pipelines and Multi-Agent Orchestration

Uploaded-document evidence:

Gestamp's operational roadmap for 2026 includes the systematic integration of advanced data analytics and smart assistants into the daily processes of its production plants.¹ The company aims to deliver pre-treated, user-segmented data directly to shop-floor workers, utilizing domain-specific smart assistants to assist in decision-making and operational troubleshooting.¹ These initiatives are managed under a structured, governed, and standardized development framework built over the past three years.¹ This framework includes specialized data controls and algorithms hosted on a unified Machine Learning Operations (MLOps) platform to ensure Gestamp maintains full ownership and efficiency of its models.¹

Public-source evidence:

Macro hiring signals show that Gestamp is actively hiring an "AI Agent Engineer & Technology Coordinator" in Spain.¹⁸ The role's core responsibilities focus on building intelligent agents, multi-agent orchestration, and generative AI pipelines.¹ Candidates are required to have experience with Microsoft's Azure Semantic Kernel, LangChain, or LlamaIndex, as well as Azure AI Foundry, Retrieval-Augmented Generation (RAG) architectures, vector embeddings, and PyTorch or TensorFlow.¹⁸ Public records indicate that Gestamp's IT divisions are exploring generative AI as a primary tool to increase worker productivity and reduce repetitive tasks.¹³ In addition, the development teams are currently working on utilizing generative AI for the self-generation of software code.¹⁹

Assessment:

This capability is classified as a pilot and capability-building activity.¹ Gestamp has built a strong foundation by deploying a corporate MLOps platform to govern and retrain localized algorithms with proprietary manufacturing specifications.¹ However, the deployment of generative AI and intelligent agentic systems remains in the early stages of corporate development.¹ The company's hiring focus on Azure Semantic Kernel and RAG architectures shows a clear intention to build internal agentic AI systems that can query corporate data sources and automate complex backend services.¹⁸ While these systems are not yet operating at scale across the production floor, Gestamp's planned 2026 rollout of domain-specific smart assistants represents a clear path to bring generative AI out of the lab and onto the shop floor to assist factory workers.¹

2.4 Integrated Manufacturing Execution Systems (MES) and Enterprise Software

Uploaded-document evidence:

Gestamp regulates and coordinates its global project lifecycle through its Gestamp Product Creation System (GPCS), which serves as a central repository for all project documentation, business cases, and risk parameters.¹ In 2025, the company made significant progress in integrating its digitalization and Industry four point zero teams with traditional manufacturing operations.¹ This integration is supported by the co-development of GeSmart Fusion, a collaborative digital solution built through the joint efforts of corporate IT teams and the Asia Division.¹ GeSmart Fusion is designed to provide top-level factory floor digitalization, bridging the gap between physical machinery and corporate IT systems.¹

Public-source evidence:

To manage daily plant operations, Gestamp relies heavily on Sisteplant's Captor Manufacturing Execution System (MES) and SAP ERP platforms.²⁰ Job postings for maintenance technicians and production coordinators in West Virginia, Alabama, and Illinois show that Captor is integrated with SAP.²⁰ This software combination allows for computerized work-order completion, real-time OEE reporting, and stamping line scheduling based on raw material availability and assembly needs.²¹ The GeSmart Fusion application is deployed on Android devices directly on the Gestamp shop floor.²⁵ This app allows industrial teams to monitor operations in real-time, coordinate tasks, manage workflows, and minimize manual errors on the factory floor.²⁶ Global SAP analyst postings in Chennai show that IT teams are responsible for ensuring the integration of SAP, Captor, and GeSmart systems.²³

Assessment:

The evidence supports a status of scaled internal deployment for Gestamp's industrial software systems.¹ By combining Sisteplant's Captor MES with its proprietary GeSmart Fusion application, Gestamp has built a highly integrated digital layer on top of its SAP ERP backbone.²³ This solves a major operational challenge: the disconnect between high-level

enterprise planning and the reality of the shop floor.¹⁶ Operators and managers are guided by real-time alerts, contextualized instructions, and automated data capture, which helps drive operational discipline and accelerates continuous improvement.²⁷

2.5 Sovereign Cloud Data Networks and Supply Chain Data Lakes

Uploaded-document evidence:

During the 2025 financial period, Gestamp consolidated its federated environment for digital solutions.¹ This system uses a shared approach, allowing corporate IT teams and regional manufacturing divisions to co-develop and deploy digital solutions.¹ This federated model ensures that standard data structures and governance protocols are maintained across the group, while allowing regional teams to adapt applications to local plant needs.¹

Public-source evidence:

In October 2023, Gestamp officially joined the Catena-X project, the global automotive industry standard for sovereign data exchange.²⁹ Catena-X is designed to replace partner-specific data connections with an interoperable open-source ecosystem, using dataspace connectors (specifically, the Eclipse Dataspace Connector, or EDC) to enable secure peer-to-peer data sharing.³⁰ This allows Gestamp to retain complete data sovereignty, deciding who has access to its data and under what conditions.³⁰ To support this standard, Gestamp is building a global supply chain "lake house".¹⁵ This architecture allows the company to read large volumes of shop-floor and logistics data "in batch" while maintaining strict data governance, creating a streamlined, standardized data environment across all its global locations.¹⁵

Assessment:

Gestamp's data standardization and sovereign data exchange capabilities represent a consortium-supported operational deployment.¹⁵ Catena-X participation solves a major strategic problem: the need to securely share data across complex global automotive supply chains to comply with new sustainability and carbon accounting regulations.³⁰ By building a global data lake house and standardizing its manufacturing data, Gestamp can easily share verified component footprint calculations and quality data with OEMs.¹⁵ This data standardization also serves as a foundational layer, allowing Gestamp to train and scale advanced industrial AI algorithms across different plants.¹⁵

SECTION 3 — Talent, teams, and operating model

3.1 Direct and External Workforce Demographics

Uploaded-document evidence:

Gestamp's global direct workforce consisted of forty-two thousand four hundred and sixty-six salaried employees as of December thirty-one, 2025, representing a three percent reduction

compared to the forty-three thousand seven hundred and fifty-seven direct salaried employees managed in the 2024 financial period.¹ This contraction is a result of a clear cost-control and workforce-rightsizing strategy to counter shifting market dynamics.¹ In terms of geographic distribution, Gestamp's direct salaried workforce is concentrated in major automotive hubs, with six thousand three hundred and twenty-seven employees in Spain, four thousand nine hundred and ninety-eight in Brazil, four thousand eight hundred and two in China, four thousand and ten in the United States, three thousand four hundred and thirty-four in Germany, three thousand four hundred and six in Mexico, and three thousand three hundred and twenty in Turkey.¹ Underperforming operations in Argentina and Slovakia underwent workforce reductions of twenty-one percent and thirteen percent, respectively, bringing salaried staffing to six hundred and fifty-two in Argentina and three hundred and ninety-five in Slovakia.¹ Conversely, Gestamp expanded direct staffing in growing markets, with Japan growing by ten percent to one hundred and thirty-eight, Thailand growing by fourteen percent to sixteen, and India growing by fifteen percent to one thousand two hundred and ninety-two.¹ To support this direct workforce, Gestamp managed an average of five thousand four hundred and eleven non-salaried external workers in 2025, which represents a three percent reduction compared to the five thousand five hundred and seventy-one external workers managed in 2024.¹ Gestamp's dedicated R&D and innovation workforce includes over one thousand seven hundred specialized professionals globally, distributed across its thirteen R&D centers.¹

Public-source evidence:

While Gestamp maintains a large global engineering and manufacturing workforce, its dedicated internal software development team is structured under the Gestamp Development Department.²⁶ This internal team is responsible for co-developing key digital applications, such as the GeSmart Fusion mobile platform, and is supported by local plant-level IT teams.²³

Assessment:

The direct and external workforce distribution shows that Gestamp is actively managing its headcount to protect operating margins amidst volatile automotive volumes.¹ The contraction in both salaried and external agency workforces shows that Gestamp's digital and automation strategy is focused on increasing labor productivity.¹ The company does not maintain a massive internal IT workforce; instead, it utilizes an efficient talent model that concentrates software and digital resources into key regional hubs.¹⁵ This allows Gestamp to maintain a lean corporate structure while utilizing localized expertise to drive digital initiatives, such as the co-development of GeSmart Fusion.¹

3.2 Digital and AI Talent Concentration

Uploaded-document evidence:

Gestamp's talent management and corporate training programs are designed to upskill and reskill employees to prepare them for the digital transition.¹ During 2025, the company

delivered a total of one million ninety-four thousand six hundred and forty-nine hours of training.¹ This training effort resulted in an average of twenty-five point eight hours of training per salaried employee.¹ To support its electrification and digitalization strategies, Gestamp's corporate training department managed several global programs, including the launch of ten specialized training programs in digitalization and electric vehicles in 2025, compared to five programs in 2024.¹

Public-source evidence:

The Gestamp Macro AI Hiring dataset, containing an observed pool of two thousand six hundred and eighty-five job postings, reveals a highly concentrated and targeted hiring strategy.¹ Within this dataset, only three postings were classified as AI-core, and ten were classified as AI-adjacent.¹ Geographically, all three observed AI-core postings were located in Spain, representing zero point seventy-nine percent of Spain's total observed postings.¹ In terms of organizational departments, one hundred percent of the observed AI-core roles sit within the "IT and Data" business area, representing seven point thirty-two percent of total postings in that department.¹ From a seniority perspective, all three AI-core postings were classified as mid-level positions.¹

Assessment:

The concentration of AI-core hiring in Spain and within the IT and Data business area indicates that Gestamp's advanced AI and machine learning development is highly centralized.¹ While the company has connected seventy plants and deployed over ten thousand active AI rules globally, it is not hiring large, localized AI engineering teams at each individual factory.¹³ Instead, Gestamp utilizes its centralized IT division in Spain to develop, train, and test core machine learning models.⁸ These centralized models are then packaged and deployed globally as standardized digital services, ensuring high consistency, strict quality control, and optimized development costs.¹

3.3 Hybrid Operating Model and Consortium Partnerships

Uploaded-document evidence:

Gestamp's operating model relies heavily on collaboration and coordination between different corporate departments and operational divisions.¹ In 2025, Gestamp's Digital and Smart Factory teams worked closely with plant-level operational managers to transition from isolated digital projects toward integrated digital operations.¹ This federated approach ensures that standard data governance protocols are maintained globally, while local plants can co-develop customized tools, as shown by the GeSmart Fusion project co-developed with the Asia Division.¹

Public-source evidence:

Gestamp utilizes a hybrid operating model, combining its internal "Gestamp Development

Department" and "AI team" ⁸ with major external technology partners, including DXC Technology for cloud migration and ServiceNow automation ¹¹, Telefónica Tech for private five-G networks and edge computing ¹², Sisteplant for the Captor MES software ²⁰, and Microsoft for Azure cloud infrastructure and database hosting.³³ Furthermore, Gestamp is a founding promoter of "IndesIA", the first industrial AI consortium in the Spanish industrial sector.³⁵ Established in June 2021 alongside Repsol, Navantia, Técnicas Reunidas, Telefónica, and Microsoft, IndesIA is a catalyst project designed to build a library of industrial AI use cases, develop a large-scale interoperable industrial data platform, and bridge the STEM training gap through upskilling and reskilling programs.³⁴ Gestamp's Chief Information Officer, Pablo de la Puente, serves as the treasurer of the IndesIA consortium.³⁴

Assessment:

The evidence outlines a highly cooperative operating model.¹ Gestamp's hybrid model of combining internal expertise with key enterprise software vendors (DXC, Sisteplant, Microsoft, Telefónica Tech) allows the company to implement advanced Industry four point zero solutions without the overhead of maintaining a massive internal IT organization.¹¹ By co-founding IndesIA and partnering with organizations like the Basque Artificial Intelligence Center (BAIC), Gestamp is actively leveraging consortium-based innovation.⁸ This approach allows Gestamp to share development costs, access standardized data schemas, and accelerate its digital transition by collaborating with other industrial leaders.³⁵

3.4 Artificial Intelligence Governance and Policy Compliance

Uploaded-document evidence:

Following the approval of the General Artificial Intelligence Policy by Gestamp's Board of Directors in December 2024, the company has fully integrated its principles into its global operations.¹ The policy is aligned with Regulation (EU) 2024/1689 of the European Parliament and of the Council (commonly known as the EU AI Act) and applies to all group companies globally, including operations in territories outside the European Union.¹ To oversee this policy, Gestamp created an "Artificial Intelligence Committee" as the corporate oversight and control body.¹ This committee is responsible for proposing Gestamp's AI strategy, supervising compliance with legal and internal regulations, and reviewing corporate rules governing AI systems.¹ Gestamp has also implemented a single, corporate-wide demand management tool through which all employee requests for AI access, software development, or third-party AI procurement must be made, as well as a standardized AI project management procedure.¹

Public-source evidence:

While Gestamp's public sustainability reports outline its commitment to ethical AI, public job descriptions for technology coordinators highlight that Gestamp's AI projects are subject to strict compliance, data protection, and cybersecurity reviews before deployment.¹⁸

Assessment:

Gestamp has established a highly centralized and mature AI governance structure.¹ By aligning its General AI Policy with the EU AI Act and applying it globally, Gestamp is enforcing a single high standard of data quality, bias prevention, and safety across all its plants, even in markets with weak local AI regulations.¹ The use of a single demand management tool and the oversight of the AI Committee ensure that Gestamp avoids unapproved AI software procurement.¹ This structured governance model minimizes compliance, regulatory, and security risks while ensuring that all AI development is aligned with the company's strategic business objectives.¹

SECTION 4 — What the evidence implies for investment priorities and competitor monitoring

4.1 Priority 1: Scaled Factory Digitalization and Edge Computing (Industry 4.0)

Uploaded-document evidence:

Gestamp's Industry four point zero strategy is built around creating highly connected, efficient, and flexible production plants.¹ In 2025, the company focused on driving plant-level profitability by utilizing digitalization, early anomaly detection, and real-time digital assistance to factory professionals.¹ The co-development of GeSmart Fusion between corporate IT and the Asia Division represents a major step in building a standardized, globally governed digital factory platform.¹

Public-source evidence:

Partner case studies from DXC Technology and Telefónica Tech outline that Gestamp has successfully connected over seventy plants globally and applied more than ten thousand AI rules on the factory floor.¹² This cloud-to-edge architecture, combined with private five-G networks, enables Gestamp to run real-time digital twin simulations to monitor machine health, run predictive maintenance, and optimize logistics flows.¹²

Assessment:

For a competitor, Gestamp's scaled deployment of digital twins and edge processing represents a significant competitive advantage.¹² Competitors that rely on traditional, paper-based shop-floor reporting or isolated MES installations will struggle to match Gestamp's operational speed and machine reliability.¹⁷ Gestamp's edge infrastructure allows its plants to identify process bottlenecks and machine anomalies in near real-time, reducing downtime and optimizing raw material usage.¹ This operational posture enables Gestamp to protect its operating margins and absorb labor and energy cost pressures more effectively than its competitors.¹ Competitors should monitor the speed at which Gestamp expands its five-G edge deployments and connects its remaining forty-five factories.¹¹

4.2 Priority 2: Deep Learning for Zero-Defect Weld Quality Control

Uploaded-document evidence:

Gestamp's Process Quality department has developed standardized quality methods for critical manufacturing processes, with a particular focus on special processes like arc, spot, and laser welding.¹ In 2025, quality teams ran trials with advanced deep learning and artificial intelligence systems to maximize the analytical value of quality inspection equipment on the factory floor.¹ Gestamp's ultimate goal is to transition its quality management from reactive detection toward a highly preventive, data-driven Quality four point zero model.¹

Public-source evidence:

Gestamp's collaboration with the Basque Artificial Intelligence Center (BAIC) to develop a deep learning model for image-based weld defect detection is a core pilot project.⁸ The machine learning model is trained on weld bead images collected from Mapvision and SmartRay scanners, allowing Gestamp to automatically classify weld defects, identify anomalous cycles, and validate signals without destroying parts.⁸

Assessment:

If Gestamp successfully scales this deep learning quality control capability across its global assembly lines, it will set a new quality benchmark in the automotive components industry.⁸ Historically, verifying weld quality required manual inspections or destructive sampling, which are slow and prone to human error.¹ By using real-time computer vision to inspect and certify every single weld bead, Gestamp can deliver a digital quality certificate for each assembly.⁸ This significantly lowers the risk of delivering defective structural parts to OEMs, reducing warranty claims and protecting the brand.¹ Competitors relying on manual or sample-based quality inspections will face higher scrap rates, slower cycle times, and a higher risk of losing premium contracts with quality-sensitive OEMs.¹ Competitors must monitor the technical development of Gestamp's BAIC pilot and its subsequent rollout beyond the initial Spanish assembly lines.⁸

4.3 Priority 3: Sovereign and Standardized Supply Chain Data Sharing (Catena-X)

Uploaded-document evidence:

Gestamp's ESG strategy and taxonomy reporting require precise, verifiable data on carbon emissions and product lifecycles.¹ The company's decarbonization roadmap involves tracking Scope three emissions, which account for ninety-six point four percent of Gestamp's total carbon footprint and are concentrated in purchased raw materials like steel and aluminum.¹

Public-source evidence:

Gestamp's participation in the Catena-X project since 2023 is designed to enable secure, sovereign peer-to-peer data exchange across the automotive supply chain.²⁹ To support this, Gestamp is building a global supply chain "lake house" to standardize and aggregate both batch and real-time streaming data across all its locations.¹⁵ This standard data architecture allows Gestamp to securely share component footprint data, logistics parameters, and material circularity metrics with OEMs.¹⁵

Assessment:

Standardized data exchange is rapidly becoming a major strategic priority as OEMs face increasing regulatory pressure to track and verify their supply chain carbon footprints and material origins.³⁰ By standardizing its manufacturing data and connecting to Catena-X, Gestamp is positioning itself as an attractive and compliant supplier for future OEM vehicle platforms.¹⁵ Competitors that lack the software architecture to instantly share verified carbon footprint data or materials traceability will face high integration costs and could be systematically excluded from future OEM bidding processes.³⁰ Competitors must monitor Gestamp's progress in integrating its global data lake house with Catena-X, as well as any moves by major OEMs to make Catena-X compliance a mandatory requirement for new supply contracts.¹⁵
