

Macro AI Hiring Report - BorgWarner

AI capabilities identified from investment signals

Dataset facts: 6,932 observed postings, 20 AI-core postings, and 79 AI-adjacent postings. The sections below summarize the investment_signal field for AI-core postings only. Counts are observed postings in the dataset, not confirmed hires, budget, capex, or R&D expense.

Future Mobility and Sustainable Product Innovation

The company is investing in AI/ML solutions for proof-of-concept projects to drive the development of future mobility and sustainable products. This includes the deployment of AI agent and multi-agent systems within real products and engineering workflows to enhance mobility solutions. These initiatives focus on exploring new product categories and informing the strategic direction of the BorgWarner product portfolio.

AI-Enhanced Engineering and Simulation Optimization

Investment is directed toward machine learning models and deep learning capabilities to accelerate and optimize engineering design. Specific applications include using neural network structures for model order reduction of electro-thermal physical models, predicting e-motor simulation outcomes, and performing aerodynamic simulations for turbomachinery. These tools aim to predict critical positions using FEA and CAD data without requiring full simulations, thereby improving the efficiency and speed of product analysis.

Data-Driven Product Development and Propulsion Management

The company is building AI-based data analysis and statistical methods to optimize product characteristics using measurement data. This extends to the development of machine learning and data analytics algorithms for propulsion management systems, specifically designed to optimize the performance of connected and automated vehicles. These capabilities serve to refine product specifications and operational performance through advanced predictive modeling.

Operational Efficiency and Strategic Decision Support

Investment is being made in agentic AI systems and AI-driven tools to meet 2026 engineering efficiency targets and support technology scouting and project selection for automotive electrification. These systems are used to translate business problems into technical solutions and manage the end-to-end deployment of AI projects. To support these activities, the company is developing an enterprise data analytics and AI/ML platform to provide advanced analytics capabilities to internal data teams across the organization.

AI hiring trend

No AI roles by month

AI-related roles by month

AI roles share by year

AI roles mix by year

The dataset contains 6932 observed postings. AI-core postings are 20; AI-adjacent postings are 79. Years with AI-related evidence: 2022: AI-core 0/456 (0.0%), AI-adjacent 2/456; 2023: AI-core 3/1073 (0.3%), AI-adjacent 6/1073; 2024: AI-core 4/1291 (0.3%), AI-adjacent 9/1291; 2025: AI-core 7/2723 (0.3%), AI-adjacent 35/2723; 2026: AI-core 6/1365 (0.4%), AI-adjacent 27/1365. AI-core capability mix by year: 2023: AI / ML modeling 3; 2024: AI / ML modeling 4; 2025: AI / ML modeling 7; 2026: AI / ML modeling 4, Agentic AI 2. Read this page as posting activity over time, not as budget, confirmed hires, or employee share.

AI hiring geography

Top hiring countries

Top countries for AI roles

AI intensity by country

AI role mix in top AI countries

Largest overall posting countries: US 2067; PL 827; MX 796; PT 562; DE 517; IN 392. Countries with AI-core postings and their denominators: US: 15/2067 (0.73%); DE: 4/517 (0.77%); LU: 1/49 (2.04%). Use the denominators when reading country percentages. A smaller country posting base can produce a higher percentage from a small number of AI-core postings.

AI staffing and seniority

This page replaces skill lists with higher-level staffing information. Role archetypes: R&D design profile: 13; AI-related profile: 7. AI capability families: AI / ML modeling: 18; Agentic AI: 2. Business-area denominators: Materials Research 13/1140 (1.14%); Customer Offerings 4/691 (0.58%); It And Data 3/293 (1.02%). Seniority counts inside AI-core postings: Junior 14, Senior 3, Mid Level 3. Use this page to understand the type of profiles being staffed and where they sit in the organization, not to infer budget or employee share.

AI breadth across capability pockets

The matrix locates AI-core postings by capability family and business area. Capability-family counts: Ai MI Modeling 18; Agentic Ai Systems 2. Business-area counts: Materials Research 13; Customer Offerings 4; It And Data 3. Nonzero cells: Ai MI Modeling in Materials Research: 12; Ai MI Modeling in Customer Offerings: 3; Ai MI Modeling in It And Data: 3; Agentic Ai Systems in Customer Offerings: 1; Agentic Ai Systems in Materials Research: 1. Read the bubbles as a map of where the observed AI-core postings sit, not as project size, budget, or strategic priority.

Appendix: brief label guide

Score 0 means no explicit AI-role signal. A posting can still be technical and remain score 0. Score 1 means AI-adjacent: AI is mentioned, but it is not the core responsibility of the role. Score 2, called AI-core in this report, means AI, ML, LLMs, GenAI, MLOps, or related AI capability is explicit and central to the role. Primary category describes the capability family, such as AI / ML modeling, LLM / GenAI applications, agentic AI systems, industrial automation, enterprise systems, or materials-science R&D. Business area describes the organizational context, such as IT and data, manufacturing operations, materials research, supply chain, customer offerings, sales and marketing, or corporate functions. Counts are observed postings in the enriched dataset. They are not confirmed hires, employee counts, budgets, capex, or R&D expense.
